

10.13039/501100011033 and “ERDF A way of making Europe”, and from Generalitat de Catalunya under project 2021-SGR-00856.

Author contributions

J.V and E.C conceptualised the study, J.M developed the methodology, performed data analyses, E.R performed data analyses, wrote the original draft and all authors critically discussed the results, revised the paper and approved the final manuscript.

Competing interests

The authors declare that they have no competing interests.

Data availability

The data that support the findings of this study are available from the corresponding author upon request. Additionally, the tweet IDs can be accessed in our GitHub repository at <https://github.com/remiss-project/remiss-data>.

Supplementary Material

Far-right party influence on polarisation dynamics in electoral campaigns

S1. Extended Stability of Communities

This section provides additional results for the Section 3.4 “Stability of communities” from the main article. Like in the main article, we compute the probability of a user to change from one community at one specific day to another community the day after.

By comparison, Fig. 10 in the main article contains only the communities that are labelled, the ones associated with the main political parties participating in the electoral race. However, here additional communities found by the algorithm are included. These smaller communities are described in Table 1 for Andalusia and in Table 2 for Barcelona. Fig. S1.1 shows the community change probabilities for Andalusia dataset while Fig. S1.2 presents the corresponding data for Barcelona. For both cases each community is represented by the username of the central node. Also, they are ordered by the number of users.

Fig. S1.1 Estimation of probability of a user belonging to community X in a day to become a member of the community Y the day after for Andalusia dataset. Communities are labelled with their most central user.

In Andalusia, we observe that the community centered around *@ImmaNietoC* (PorA) has the highest number of other communities with non-null probabilities of

sending users, indicating greater connectivity compared to other communities. Interestingly, the most stable community is associated with *@Macarena.Olona* (Vox), while those with the lowest probabilities of retaining users are linked to the following usernames: *@PizarroMariaJo*, *@cubacooperaveCO*, *@Gatajusticie*, *@PartidoPACMA* and *@santi544*.

In Barcelona, *@JordiGraupera* (Junts community) and *AdaColau* (BComú) are the central nodes in the communities that attract the most users from other groups. The most stable community is led by *@Igarrigavaz* (Vox), which also has a 0.9 probability of receiving users exclusively from the community centered on *@TITORODRIGUEZZ*. Conversely, the least stable labelled community is associated with *@HiginiaRoig* (CUP community). Lastly, it is worth noting that there are two communities detected by the algorithm that have zero probability everywhere.

Fig. S1.2 Estimation of probability of a user belonging to community X in a day to become a member of the community Y the day after for Barcelona dataset. Communities are labelled with their most central user.

S2. Voter Perceptions of Political Ideology in Andalusia

The *Centro de Estudios Andaluces* conducted interviews to gather the perceptions of Andalusian society on politics, electoral behaviour, and other topics (e.g., the Ukraine-Russia conflict, the economy, etc.). In the “*Barómetro Andaluz, Estudio de Opinión Pública de Andalucía*” ([Fundación CENTRA, 2022](#)), with data collected in March 2022, citizens were asked specific questions regarding how they perceived the parties they voted for. One question asked voters of a particular party: “*When talking about*
